## Two maps

Caveat: all spaces are compact Hausdorff

Given  $X$  and a cardinal  $\kappa$  (with discrete topology) form  $\beta(\kappa \times X)$ .

## Two maps

Caveat: all spaces are compact Hausdorff

Given  $X$  and a cardinal  $\kappa$  (with discrete topology) form  $\beta(\kappa \times X)$ .

There are two natural maps to consider

## Two maps

Caveat: all spaces are compact Hausdorff

Given  $X$  and a cardinal  $\kappa$  (with discrete topology) form  $\beta(\kappa \times X)$ .

There are two natural maps to consider

- $\beta\pi_\kappa : \beta(\kappa \times X) \rightarrow \beta\kappa$  and

## Two maps

Caveat: all spaces are compact Hausdorff

Given  $X$  and a cardinal  $\kappa$  (with discrete topology) form  $\beta(\kappa \times X)$ .

There are two natural maps to consider

- $\beta\pi_\kappa : \beta(\kappa \times X) \rightarrow \beta\kappa$  and
- $\beta\pi_X : \beta(\kappa \times X) \rightarrow \beta X$

## Two maps

Caveat: all spaces are compact Hausdorff

Given  $X$  and a cardinal  $\kappa$  (with discrete topology) form  $\beta(\kappa \times X)$ .

There are two natural maps to consider

- $\beta\pi_\kappa : \beta(\kappa \times X) \rightarrow \beta\kappa$  and
- $\beta\pi_X : \beta(\kappa \times X) \rightarrow \beta X$

The map  $\beta\pi_\kappa$  helps divide  $\beta(\kappa \times X)$  into manageable pieces:

## Two maps

Caveat: all spaces are compact Hausdorff

Given  $X$  and a cardinal  $\kappa$  (with discrete topology) form  $\beta(\kappa \times X)$ .

There are two natural maps to consider

- $\beta\pi_\kappa : \beta(\kappa \times X) \rightarrow \beta\kappa$  and
- $\beta\pi_X : \beta(\kappa \times X) \rightarrow \beta X$

The map  $\beta\pi_\kappa$  helps divide  $\beta(\kappa \times X)$  into manageable pieces:

- $\{\alpha\} \times X$  for  $\alpha \in \kappa$  (that's just  $X$ ), and

## Two maps

Caveat: all spaces are compact Hausdorff

Given  $X$  and a cardinal  $\kappa$  (with discrete topology) form  $\beta(\kappa \times X)$ .

There are two natural maps to consider

- $\beta\pi_\kappa : \beta(\kappa \times X) \rightarrow \beta\kappa$  and
- $\beta\pi_X : \beta(\kappa \times X) \rightarrow \beta X$

The map  $\beta\pi_\kappa$  helps divide  $\beta(\kappa \times X)$  into manageable pieces:

- $\{\alpha\} \times X$  for  $\alpha \in \kappa$  (that's just  $X$ ), and
- $X_u = \beta\pi_\kappa^{-1}(u)$  for  $u \in \kappa^*$  (an enriched version of  $X$ ).

# Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

## Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

The space  $X_u$  is often called the ultracopower of  $X$  by the ultrafilter  $u$

## Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

The space  $X_u$  is often called the ultracopower of  $X$  by the ultrafilter  $u$  and  $\pi_u : X_u \rightarrow X$  the corresponding codiagonal map.

## Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

The space  $X_u$  is often called the ultracopower of  $X$  by the ultrafilter  $u$  and  $\pi_u : X_u \rightarrow X$  the corresponding codiagonal map.

Why?

## Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

The space  $X_u$  is often called the ultracopower of  $X$  by the ultrafilter  $u$  and  $\pi_u : X_u \rightarrow X$  the corresponding codiagonal map.

Why?

Well

## Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

The space  $X_u$  is often called the ultracopower of  $X$  by the ultrafilter  $u$  and  $\pi_u : X_u \rightarrow X$  the corresponding codiagonal map.

Why?

Well,  $\kappa \times X$  is normal and hence  $\{\text{cl}_\beta A : A \in 2^{\kappa \times X}\}$  is a base for the closed sets of  $\beta(\kappa \times X)$ .

## Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

The space  $X_u$  is often called the ultracopower of  $X$  by the ultrafilter  $u$  and  $\pi_u : X_u \rightarrow X$  the corresponding codiagonal map.

Why?

Well,  $\kappa \times X$  is normal and hence  $\{cl_\beta A : A \in 2^{\kappa \times X}\}$  is a base for the closed sets of  $\beta(\kappa \times X)$ .

Also,  $2^{\kappa \times X}$  is naturally isomorphic to  $(2^X)^\kappa$ :

## Ultracopowers and Codiagonal maps

Each restriction  $\pi_u = \beta\pi_X \upharpoonright X_u$  maps  $X_u$  onto  $X$ .

The space  $X_u$  is often called the ultracopower of  $X$  by the ultrafilter  $u$  and  $\pi_u : X_u \rightarrow X$  the corresponding codiagonal map.

Why?

Well,  $\kappa \times X$  is normal and hence  $\{\text{cl}_\beta A : A \in 2^{\kappa \times X}\}$  is a base for the closed sets of  $\beta(\kappa \times X)$ .

Also,  $2^{\kappa \times X}$  is naturally isomorphic to  $(2^X)^\kappa$ :

$\langle A_\alpha : \alpha < \kappa \rangle$  corresponds to  $\bigcup_\alpha \{\alpha\} \times A_\alpha$ .

## Why enriched?

Ultrapowers are quite popular because they are richer than the initial structures.

## Why enriched?

Ultrapowers are quite popular because they are richer than the initial structures.

Countable consistent systems of equations suddenly have solutions.

## Why enriched?

Ultrapowers are quite popular because they are richer than the initial structures.

Countable consistent systems of equations suddenly have solutions.

The initial structure sits nicely (elementarily embedded) in the ultrapower.

## Why enriched?

Ultrapowers are quite popular because they are richer than the initial structures.

Countable consistent systems of equations suddenly have solutions.

The initial structure sits nicely (elementarily embedded) in the ultrapower.

If  $2^X$  sits nicely inside  $(2^X)_u$  then one would expect  $\pi_u : X_u \rightarrow X$  to be a nice continuous surjection.

## Why enriched?

Ultrapowers are quite popular because they are richer than the initial structures.

Countable consistent systems of equations suddenly have solutions.

The initial structure sits nicely (elementarily embedded) in the ultrapower.

If  $2^X$  sits nicely inside  $(2^X)_u$  then one would expect  $\pi_u : X_u \rightarrow X$  to be a nice continuous surjection.

Of course niceness is in the mind of the considerer.

## Co-existential

$g$  is continuous:

## Co-existential

$g$  is continuous:

- $g$  is continuous on  $F = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i \leq n} H_i\}$

## Co-existential

$g$  is continuous:

- $g$  is continuous on  $F = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i \leq n} H_i\}$
- and on  $G = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i > n} H_i \cup (\{0\} \times [0, 2])\}$ ;

## Co-existential

$g$  is continuous:

- $g$  is continuous on  $F = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i \leq n} H_i\}$
- and on  $G = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i > n} H_i \cup (\{0\} \times [0, 2])\}$ ;
- on  $F \cap G = \omega \times \{\langle 0, 0 \rangle\}$  it takes on the value  $\langle 0, 0 \rangle$

## Co-existential

$g$  is continuous:

- $g$  is continuous on  $F = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i \leq n} H_i\}$
- and on  $G = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i > n} H_i \cup (\{0\} \times [0, 2])\}$ ;
- on  $F \cap G = \omega \times \{\langle 0, 0 \rangle\}$  it takes on the value  $\langle 0, 0 \rangle$

For each  $u \in \omega^*$  we get  $g_u[F_u] = B$  and  $g_u[G_u] = \{0\} \times [0, 2]$ ;

## Co-existential

$g$  is continuous:

- $g$  is continuous on  $F = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i \leq n} H_i\}$
- and on  $G = \{\langle n, x, y \rangle : \langle x, y \rangle \in \bigcup_{i > n} H_i \cup (\{0\} \times [0, 2])\}$ ;
- on  $F \cap G = \omega \times \{\langle 0, 0 \rangle\}$  it takes on the value  $\langle 0, 0 \rangle$

For each  $u \in \omega^*$  we get  $g_u[F_u] = B$  and  $g_u[G_u] = \{0\} \times [0, 2]$ ; so  $g_u$  is always onto.

## Co-existential

To see that  $f \circ g_u = \pi_u$  note that for every  $\langle x, y \rangle \in X$  the set  $\{n : f(g(n, x, y)) = \langle x, y \rangle\}$  is cofinite.

## Co-existential

To see that  $f \circ g_u = \pi_u$  note that for every  $\langle x, y \rangle \in X$  the set  $\{n : f(g(n, x, y)) = \langle x, y \rangle\}$  is cofinite.

It is  $[n, \omega)$  if  $\langle x, y \rangle \in H_n$

## Co-existential

To see that  $f \circ g_u = \pi_u$  note that for every  $\langle x, y \rangle \in X$  the set  $\{n : f(g(n, x, y)) = \langle x, y \rangle\}$  is cofinite.

It is  $[n, \omega)$  if  $\langle x, y \rangle \in H_n$  and it is  $\omega$  if  $y = 0$ .

## The codiagonal maps

The codiagonal maps are not confluent either.

## The codiagonal maps

The codiagonal maps are not confluent either.

$\pi_u^{\leftarrow}[C]$  splits into  $g_u^{\leftarrow}[\{0\} \times [1, 2]]$  and  $g_u^{\leftarrow}(1, 0)$ .

## The codiagonal maps

The codiagonal maps are not confluent either.

$\pi_u^{\leftarrow}[C]$  splits into  $g_u^{\leftarrow}[\{0\} \times [1, 2]]$  and  $g_u^{\leftarrow}(1, 0)$ .

The latter set even maps onto  $\omega^*$  so it has plenty components that do not map onto  $C$  under  $\pi_u$ .

Given that

- $f^{\leftarrow}[C]$  looks like  $C$  with an extra isolated point.
- $\pi_u^{\leftarrow}[C]$  does not look like  $C$  at all: something that vaguely looks like  $C$  plus a whole cloud of stuff indexed by  $\omega^*$

## How nice are these maps anyway?

Given that

- $f^{\leftarrow}[C]$  looks like  $C$  with an extra isolated point.
- $\pi_U^{\leftarrow}[C]$  does not look like  $C$  at all: something that vaguely looks like  $C$  plus a whole cloud of stuff indexed by  $\omega^*$

one wonders whether these maps are as nice topologically as their duals are algebraically.

## How nice are these maps anyway?

Given that

- $f^{\leftarrow}[C]$  looks like  $C$  with an extra isolated point.
- $\pi_u^{\leftarrow}[C]$  does not look like  $C$  at all: something that vaguely looks like  $C$  plus a whole cloud of stuff indexed by  $\omega^*$

one wonders whether these maps are as nice topologically as their duals are algebraically.

This merits further investigation.
